Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The invention learces to the Moraveira catalinaris strains in the intention also relates to immunogenic fragments of the BASB120 protein (AAB60645) and to DNA encoding it (AAF59797). The invention also relates to immunogenic fragments of the BASB120 protein, expression vectors and host cells comprising BASB120 nucleic acids, the recombinant production of BASB120, vaccine compositions comprising the compositions comprising the anti-BASB120 antibody, and a method of identifying a Moravella catarrhalis infection via the detection of BASB120 proteins or antibodies. The vaccine compositions of the invention are sprophylactic or therapeutic agents against Moravella catarrhalis is a Gram negative bacterium frequently isolated from the human upper respiratory tract, which is responsible for several catarchialis is a Gram negative bacterium frequently isolated from the human upper respiratory tract, which is responsible for several cases in children (which can lead to temporary or permanent hearing loss). It also causes pneumonia in elderly people, and sinusitis, no concomial infections and, less frequently, invasive diseases. BASB120 proteins or nucleotides may additionally be used in screening for novel and present sequence represents the Moravella catarrhalis strain aftering the Moravella catarrhalis strain

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -DLKSRGILPA 145

```
The present invention describes a purified or isolated nucleic acid sequence (I) consisting essentially of one of the 93 nucleotide sequences cy given in AAH81202 to AAH81294, where expression of the nucleic acid in a microorganism is capable of inhibiting proliferation of a microorganism.

(I) have antibacterial and antibiotic activities, and can be used in comparism, and the manufactured antibiotic is useful for cof the microorganism, and the manufactured antibiotic is useful for reducing the activity or level of a gene product required for cof the microorganism in a subject, specifically humans. The reducing that inhibit bacterial growth or proliferation can be used as antisense therapeutics for killing bacteria. In addition to concern required for proliferation can be used as diagnostic tools.

(For example, nucleic acid probes complementary to proliferation required cor proliferation can be used as diagnostic tools.

(For example, nucleic acid probes complementary to proliferation-required cor be used as probes to identify particular species of microorganisms can colinical specimens. AAH81295 to AAH81489 to AAG98431, and AAH81489 to AAH81491.

(For example, nucleic acid probes complementary to proliferation corporations given in AAG98239 to AAG98431, and AAH81480 to AAH81491.
                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acids encoding proteins required for Escherichia coliproliferation, useful for screening for antimicrobial agents -
                                                                                                                                                                                                                                                           Zyskind JW;

AAA AAHB4373 to AAHB4499 represent Escherichia coli growth and proliferation related DNA sequences (I). AAHB4500 to AAHB4670 encode the E. coli related DNA sequences (I). AAHB4500 to AAHB4670 encode the E. coli growth and proliferation related proteins given in AAG99078 and AAG98030 to AAG98099. (I) can be used as potential targets for the generation of new antimicrobial agents, and for identification of compounds which interact with the gene products of (I). In addition the expression of the proteins, the purified proteins can be used to generate reagents and screen small molecule libraries or other candidate compound libraries for compounds that can be further developed to yield novel antimicrobial compounds. In addition, nucleic acid probes complementary to (I) that are specific for particular species of microorganisms can be used to identify particular microorganism species in clinical specimens, therefore, providing a rapid and dependable method by which to identify the causative agents of a bacterial method by which to identify the causative agents of a bacterial of method by which to identify the causative agents of a bacterial completion from proliferation-required sequences can also be used to screen for specific microorganisms that produce such proteins in a specimens as specific microorganisms that produce such proteins in a specimens used in the isolation of E. coli growth and proliferation in incortion in an example from the present E. coli growth and proliferation related protein sequence SEQ ID NO:299. Novel nucleic acids that inhibit Escherichia coli proliferation, useful for screening for homologous genes and for designing expression vectors Escherichia coli; growth; proliferation; microbial; antimicrobial; bacterial infection; microorganism. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    90 RLGNYLPPMSQLLTTARSWQACGHEPYQLPPEHLWGQIVPTLHLYQDLKSRGILPANTQI 149

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        856 dpaas11g-tlqfetqkirphnakqs---sqtvmdnrltiklvpq1pamnvsft----- 905

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and in the cell interactions in higher entaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL04840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.w1po.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ5473 represent propertides. AAZ54577 to AAZ5476 and AAZ54616 to AAZ5473 represent propertides, antibodies and composition. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols. AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against chlamydia trachomatis. Antisenses and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), appressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.Wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

cellular signalling and proliferation. The HTFS proteins are useful for screening compounds for their effectiveness as agonists or antagonists of transferase activity, or for compounds that specifically bind to an HTFS protein or which modulates the activity of an HTFS protein.

Created compositions comprising an HTFS protein, HTFS paramaceutical compositions comprising an HTFS protein, HTFS protein are useful for treating a disease or condition associated with decreased or increased expression of functional HTFS pisorders with decreased or increased expression of functional HTFS pisorders of useful disporders. For example, diseases which may be treated using such compositions include cell proliferative disporders and immune disorders. For example, diseases which may be treated include atherosclerosis, hepatitis, psoriasis, cancers (including treated include atherosclerosis, hepatitis, psoriasis, cancers (including compasses, atopic dermatitis, diabetes mellitus, multiple sclerosis, chemmatoid arthritis, pancreatitis, sathma, anaemia, cirrhosis, cohors, confined the manual disease, and include and include and cancer, haemodialysis, extracorporeal circulation, confined to cancer, including lymphoma, leukaemia and manual manual diseases, included the natural or retains and manual proposed in manual diseases, for diagnostic purposes and cancers in manual the natural or retains and manual manual diseases, in compassing human diseases, and cancer in manual the natural or retains and manual proposed in manual diseases, and manual proposed and diseases and cancer, hence in manual the natural or retains and manual proposed in a manual diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to generate hybridisation probes useful in mapping the naturally occurring genomic sequences. HTFS, and its catalytic or immunogenic fragments are useful for screening libraries of compounds in a variety of drug screening techniques. Antibodies which specifically bind HTFS may be used for the diagnosis of disorders associated with the expression of agonists, antagonists or inhibitors of HTFS. The present sequence represents an HTFS protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      82 RYQAYLQSRLGNYLPPMSQLLTTARSWQACGHEPYQLPPEHLWGQIVPTLHLYQDLKSRG 141

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping are also used in diagnostics as expressed sequence tags of or identifying expressed genes. (I) is useful in gene therapy techniques (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a cod supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical cod supplement. (II) and its binding partners are useful in medical cod supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating consists for general protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations controproposition and products dependent on DNA and amino acid sequences of data and products dependent on DNA and amino acid sequence data for this patent did not appear in the printed consisting the product of the this patent did not appear in the printed sequences of the this patent did not appear in the printed sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         118 LPPEHL-----WGQIVPTLHLYQDLK-SRGILPANTQIRSVYRNPELNQC---AGGAAMS 168

                                             AAG41671;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AA253015 to AA254536, AAA254577 to AA254615, and AAY74253 to AAX75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54571 to AAZ54576 and AAZ54616 to AAZ55473 represent polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent polypeptides, the polynucleotides, antibodies and composition. The polypeptides and compositions of immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Weisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WPI; 2001-159872/16. N-PSDB; AAF59797 New BASB120 polypeptides and polynucleotides from Moraxella catarrhalis strain American Type Culture Collection 43617, for use as therapeutic agents or vaccines against bacterial infections, e.g. otitis media or pneumonia

Claim 4; Page 64; 75pp; English.

BASB120 protein (AAB60645) and to DNA encoding it (AAF59797). The invention also relates to time who morability it (AAF59797). The invention also relates to immunogenic fragments of the BASB120 protein. Compositions comprising BASB120 nucleic acids, the recombinant production of BASB120, vaccine compositions comprising the anti-BASB120, and a method of BASB120 protein or nucleic acid, an antibody against BASB120, therapeutic compositions comprising the anti-BASB120 antibody, and a method of identifying a Moraxella catarrhalis infection via the detection of BASB120 proteins or antibodies. The vaccine compositions of the invention care useful as prophylactic or therapeutic agents against Moraxella catarrhalis infections in mammals, particularly humans. Moraxella catarrhalis in a Gram negative bacterium frequently isolated from the human upper respiratory tract, which is responsible for several pathological conditions. It is responsible for about 15% of cities media cases in children (which can lead to temporary or permanent hearing cases in children (which can lead to temporary or permanent hearing consocomial infections and, less frequently, invasive diseases. BASB120 proteins or nucleotides may additionally be used in screening for novel antibacterial compounds, and in the diagnosis and staging of infections.

The present sequence represents the Moraxella catarrhalis strain The invention relates to the Moraxella catarrhalis strain ATCC43617 ATCC43617 BASB120 protein.
